REVISION HISTORY

ISSUE	DATE	REASON FOR CHANGE
1	07/2006	Original release
2	09/2006	New Fiberglass Mounting Sleeve (FMS). New installation procedure for splitters with connectorized input fibers. New routing procedure for feeder fibers
3	12/2006	New cabinet grounding system. Left and right access covers replace the single front access cover.
4	9/2009	New swing frame assembly and new cable mounting bracket.
5	4/2016	Changed format to CommScope; changed door from double to single.
6	May 2017	Format updated a second time.

ABOUT THIS MANUAL

This publication describes the OmniReach outdoor FDH 3000 288 termination cabinet. Also included are procedures for mounting the cabinet, installing additional splitter modules, installing additional connector panels, storing the splitter output fibers, connecting the splitter output fibers to the distribution fibers, and replacing damaged components.

RELATED PUBLICATIONS

Listed below are related manuals and their publication numbers. Copies of these publications can be ordered by contacting the Technical Assistance Center at 1-800-366-3891, extension 73475 (in U.S.A. or Canada) or 1-952-917-3475 (outside U.S.A. and Canada).

Title	ADCP Number
Optical Fiber Connector Wet and Dry Cleaning Instructions	**90-159**
Plug And Play Splitter Installation Guide	**96-087**

ADMONISHMENTS

Important safety admonishments are used throughout this manual to warn of possible hazards to persons or equipment. An admonishment identifies a possible hazard and then explains what may happen if the hazard is not avoided. The admonishments — in the form of Dangers, Warnings, and Cautions — must be followed at all times. These warnings are flagged by use of the triangular alert icon (seen below) and are listed in descending order of severity of injury or damage and likelihood of occurrence.

⚠ **Danger:** *Danger is used to indicate the presence of a hazard that **will** cause severe personal injury, death, or substantial property damage if the hazard is not avoided.*

⚠ **Warning:** *Warning is used to indicate the presence of a hazard that **can** cause severe personal injury, death, or substantial property damage if the hazard is not avoided.*

⚠ **Caution:** *Caution is used to indicate the presence of a hazard that **will** or **can** cause minor personal injury or property damage if the hazard is not avoided.*

GENERAL SAFETY PRECAUTIONS

⚠ **Warning:** *Wet conditions increase the potential for receiving an electrical shock when installing or using electrically-powered equipment. To prevent electrical shock, never install or use electrical equipment in a wet location or during a lightning storm.*

⚠ **Danger:** *Do not look into the ends of any optical fiber. Exposure to laser radiation may result. Do not assume the laser power is turned-off or that the fiber is disconnected at the other end.*

⚠ **Danger:** *Use adequate lifting equipment when moving or installing Fiber Distribution Hub cabinets. Verify that the maximum lift weight rating of the equipment is sufficient to handle the weight of the cabinet.*

⚠ **Danger:** *Do not stand under a Fiber Distribution Hub cabinet as it is being hoisted into position for mounting. A failure of the lifting equipment or apparatus could result in serious personal injury and cause significant damage to the cabinet.*

⚠ **Warning:** *Before digging, check with all local utilities for the presence of buried cables or pipes. Contact with underground cables or pipes, especially electric power cables and gas service lines, could interrupt local utility service and cause serious personal injury and extensive property damage.*

STANDARDS CERTIFICATION

Telcordia: This equipment complies with the applicable sections of GR-3125-CORE.

LIST OF ACRONYMS AND ABBREVIATIONS

The acronyms and abbreviations used in this manual are detailed in the following list:

AWG	American Wire Gauge
C	Centigrade
F	Fahrenheit
FDH	Fiber Distribution Hub
FMS	Fiberglass Mounting Sleeve
FTTP	Fiber To The Premises
OSP	Outside Plant
PMF	Pad Mount Frame
PNP	Plug and Play
RBR	Reduced Bend Radius
RMA	Return Material Authorization

1   DESCRIPTION

This section provides a description of the OmniReach outdoor FDH 3000 288 termination cabinet with pre-installed cables plus the cabinet specifications.

1.1   Outdoor FDH 3000 288 Termination Cabinet

The outdoor FDH 3000 288 termination cabinet with pre-installed cables shown in Figure 1 is a secure, above-ground, outdoor fiber optic distribution cabinet designed to hold the various optical components required for Fiber To The Premises (FTTP) distribution network applications.
Figure 1. Typical Outdoor 288 Termination Cabinet

The version of the cabinet described in this publication is designed for **pedestal-mount** applications. The interior of the outdoor FDH 3000 288 termination cabinet consists the following primary components:

Distribution Panels: Provide a point for connecting the splitter output fibers with the terminated distribution cable fibers. Each distribution panel provides mounting spaces for 72 bulkhead adapters. The cabinet may be equipped with one, two, three, or four distribution panels. Adapters for UPC/SC or APC/SC style connectors are available.

Storage Panel: Provides a temporary "parking lot" for unused splitter output fibers. Each splitter module comes with a connector pack that mounts in the storage panel. Up to nine 8-position connector packs (72 fibers total) can be mounted in the storage panel.

Radius Limiters: Provide a place for storing excess slack from the splitter output fibers.

Splitter Compartment: Provides a place for mounting the splitters. Will support up to twenty-four splitters. Unused splitter slots can be used for pass-though fibers. The splitters specified for use with the FDH 3000 cabinet are equipped with reduced bend radius (RBR) fibers.

Sliding Adapter Pack (Input panel) – Provides a place for terminating spare feeder cable fibers. Spare feeder cable fibers may be used for signal pass-through functions.

Grounding Block – Provides a common point for grounding OSP cables with metallic strength members and for connecting a cable from an earth ground source to the cabinet.

The exterior shell of the outdoor cabinet is constructed of heavy gauge aluminum and is coated with an almond-colored finish. Each cabinet is equipped with two front doors that provide full front access to the optical components. The cabinet doors are equipped with a tamper-resistant latch that includes a hasp for a padlock, stainless steel hinges, and door catches that prevent accidental closing. Access to the cabinet requires a 216B key tool (accessory) to release the latch handle. Lifting eyes are provided for hoisting the cabinet into position for mounting. Each cabinet is equipped with a 6-inch ground spacer/riser to provide ground clearance. If more ground clearance is required, an additional 6-inch spacer/riser is available separately as an accessory item.

The outdoor cabinet may be mounted on a concrete pad or on a fiberglass mounting sleeve. Mounting kits (accessories) are available for each mounting option. The feeder and distribution cables enter/exit the cabinet from the bottom. Clamps secure the cables to the inside of the cabinet. The bottom of the cabinet is enclosed with a moisture barrier. The cable entry/exit hole is fitted with a flexible membrane to resist the entry of dust and moisture. GORE membrane vents allow any moisture that may accumulate within the cabinet to be released.

The cabinet is equipped with factory-installed outside plant (OSP) distribution and feeder cables. Ribbon and stranded type cables with either dielectric or armored construction are available. The cable stubs are 100 feet in length. Cables with metallic strength members are fitted with grounding terminals which are connected to the grounding block with jumper cables. The specifications for the outdoor FDH 3000 288 termination cabinet are provided in Table 1.

Table 1. Outdoor 288 Termination Cabinet Specifications

| PARAMETER	SPECIFICATION
Cabinet	
Dimensions (H x W x D) Pedestal-Mount (See Figure 2)	36 x 27 x 18.5 x inches (91.4 x 68.6 x 47.0 cm)
Weight (fully loaded)	150 lbs (68 kg)
Certification (pending)	GR-3125-CORE
Distribution panels (maximum)	4
Distribution ports	Up to 288 with four 72-port distribution panels
Distribution port adapters/connectors	UPC/SC or APC/SC,
Feeder/Distribution cable length	100 ft.
Splitter compartment splitter capacity	24 splitters
Splitter compartment adapter capacity	48 adapters
Storage panel capacity	72 connectors
Sliding adapter pack capacity	36 adapters
Splitter Modules	
Splitter module input and output pigtails	Reduced bend radius fiber terminated with UPC/SC or APC/SC connectors
Test bandpass	1260–1360 nm, 1480–1500 nm, 1550–1560 nm

	17.1 dB with UPC, 17.3 dB with APC
	20.8 dB with UPS, 21 dB with APC
	14.5 dB with UPC, 14.7 dB with APC
	17.8 dB with UPC, 18 with APC
Figure 2. Outdoor 288 Termination Cabinet Dimensions

2   BEFORE STARTING INSTALLATION

This section provides general installation considerations, unpacking and inspection procedures, and lists the tools and materials required for cabinet installation.

2.1   Installation Overview

Installation of the outdoor 288 termination pedestal-mount cabinet involves the following main tasks:

Installing a Support Base – The cabinet must be mounted on a suitable support base. The following two mounting options are available:

- **Fiberglass Mounting Sleeve (FMS)** – The FMS is a rectangular sleeve that mounts in the ground. The FMS provides a stable mounting platform plus storage space under the cabinet for OSP cable slack. The FMS may also be used as a splicing vault for OSP cables. Both a small and a large size version of the FMS are available.

- **Poured Concrete Pad** – Concrete slab with Pad Mounting Frame (PMF). The PMF is a stainless-steel frame that is embedded in the concrete during installation of the slab. The cabinet attaches to the PMF which holds it securely to the slab.

Mounting the Cabinet – After the support base is installed, the cabinet must be secured to the support base. The OSP feeder and distribution cables must be uncoiled and routed to a separate splice enclosure (not provided) before the cabinet is secured to the support base.

Splitter Installation – The cabinet may be ordered with one or two splitters. If additional splitters are required, they must be ordered separately. All splitter modules that are ordered separately must be installed in the splitter compartment and the input connectors must be mated with the terminated feeder cable fibers.

Splitter Output Fiber Connections – Service is enabled by connecting the splitter output fiber connectors to the subscriber distribution ports. Unused output fibers are temporarily "parked" in the storage panel until they are needed for service.

2.2   Unpacking and Inspection

This section provides instructions for opening the shipping boxes, verifying that all parts have been received, and verifying that no shipping damage has occurred.

Use the following procedure to unpack and inspect the cabinet and all accessories:

1. Open the shipping carton(s) and carefully unpack the cabinet and any accessories from the protective packing material.

2. Open the cabinet doors (requires 216B key tool) and check for missing ship-along parts (see installation drawing included with cabinet) or broken parts. If there are damages, contact ADC for an RMA (Return Material Authorization) and to reorder if replacement is required.

2.3   Outdoor Cabinet Installation Hardware

The outdoor cabinet is shipped with various parts (see Table 2) for securing the cabinet to the FMS or PMF. Verify that the parts specified are received.

Table 2. Cabinet Installation Hardware

ITEM	QUANTITY
3/8 x 1-inch hex head capscrews	4
3/8-inch flat washers	4
3/8-inch lock washers	4
Isolation gasket	1

2.4   OSP Cable and Cabinet Grounding Cables

The cabinet is equipped with a common grounding block that is used to tie together all the components of the cabinet that must be grounded. The cabinet itself and any OSP cables with metallic strength members must be connected to an earth ground source. Information on grounding is provided in the sections that cover cabinet mounting.

2.5   Tools and Materials Required for Installation

The following tools and materials are required for cabinet installation:

All Cabinet Installations

- Hammer
- Wire cutter
- Utility knife
- Screwdriver (flat blade)
- Tape measure
- Pen or marker
- 216B key tool (accessory - required to open cabinet door)
- 3/16-inch security hex-head wrench (required to open riser security panel)
- Padlock (optional)
- Grounding system, copper wire, and grounding clamp (per local requirements)
- Splicing equipment for splicing OSP feeder and distribution cables
- One large tweezers or two small flat-bladed screwdrivers
- Lifting equipment for hoisting the cabinet into position for mounting

Fiberglass Mounting Sleeve Installation

- Fiberglass Mounting Sleeve kit (FMS-ACE100-KIT-A or FMS-FD3EG-LKIT-A)
- Optional 6-inch ground spacer (FD3-RSRE06)

- 9/16-inch wrench
- Security key (accessory - required to remove lifting eyes)
- Excavation and earth moving equipment
- Stone aggregate
- Tamping equipment
- Level
- Hole saw and drill (use to cut holes for cable conduit if pre-drilled holes are not usable)
- Landscaping equipment and site restoration supplies

Concrete Pad Installation

- Pad Mount Frame kit for FDH 3000 cabinet (FD3-PMFE06)
- Optional 6-inch ground spacer (FD3-RSRE06)
- 9/16-inch wrench
- Security key (accessory - required to remove lifting eyes)
- Excavation and earth moving equipment
- Concrete finishing equipment
- Approximately 11.5 cu. ft. concrete
- Sand or gravel
- Tamping equipment
- 2 x 6 inch framing lumber
- 1 x 4 inch wooden stakes (4)
- Nails and construction screws
- Utility wire (to secure PMF during installation)
- Saw
- Drill with screwdriver bits
- Square
- Level
- Landscaping equipment and site restoration supplies

2.6   Cabinet Mounting

The next two sections provide installation instructions for the mounting the cabinet on either an FMS or a concrete pad. Use whichever procedure is appropriate for the installation.

3 MOUNTING THE CABINETE ON A FIBERGLASS MOUNTING SLEEVE

The FMS is a fiberglass and polymer concrete sleeve that may be used to support the cabinet at ground level. The FMS may also be used as a splicing vault. Four vertical cable racks are molded into the sides of the FMS to accommodate removable rungs (not provided). The rungs may be used to provide support for splice cases or OSP cable storage.

The FMS is available in both a small and large size. The small size FMS, shown in Figure 3, measures **internally** 28 x 57.5 inches (71 x 146 cm) and is 30 inches deep (76 cm). The large size FMS, shown in Figure 4, measures **internally** 48 x 60 inches (121.9 x 152.4 cm) and is 37.25 inches (94.6 cm) deep.

Figure 3. Small Fiberglass Mounting Sleeve (FMS-ACE100-KIT-A)

Figure 4. Large Fiberglass Mounting Sleeve (FMS-FD3EG-LKIT-A)

3.1 Installation Recommendations

The site chosen for the installation must conform to all local codes and any permits required must be obtained prior to the start of installation. The location must be accessible and provide adequate parking for worker and vehicle safety. Situate the FMS close to the trench that was used for routing the OSP fiber cables for the network distribution system.

The installed cabinet must not create a visual or physical obstruction to vehicular or pedestrian traffic. Ensure that there is sufficient space on all sides to facilitate cabinet installation. Depending on the landscaping requirements, the top surface of the mounting sleeve may be located from 0 to 4 inches (10.2 cm) above the surrounding grade.

3.2 Excavation

The excavation must be large enough to provide a fill base that will maintain stability for the FMS and the cabinet mounted on it. There must be room for 12 inches (30.5 cm) of fill below and on each side of the FMS. The excavation dimensions for the small FMS are shown in Figure 5. The excavation dimensions for the large FMS are shown in Figure 6. Excavate a rectangular hole for the FMS.

Figure 5. Excavation Recommendations for FMS-ACE100-KIT-A (Small FMS)

Figure 6. Excavation Recommendations for FMS-FD3EG-LKIT-A (Large FMS)

3.3 Placement of the FMS

⚠ **Danger:** *Use adequate lifting equipment when installing the FMS. Do not stand in the hole while placing the FMS in position. An unexpected shift of the FMS could result in personal injury.*

Use the following procedures to place the FMS into the excavation.

1. Fill the bottom of the hole with stone aggregate, tamping it as it is filled to build a 12 inch (30.5 cm) layer with a level surface. The stone aggregate will provide a stable base to support the FMS.

   ▶ **Note:** Use crushed rock 3/8-inch or less in size mixed with stone dust (per local practice) to fill the hole. The name of the material may differ in different geographical areas. Possible names are Class 5, stone dust, aughts (0s) and ones (1s), or stone aggregate

2. Use appropriate lifting equipment to place the FMS into the center of the hole. Lifting bolts are provided on the sides of the FMS for attaching a sling or chain.

3. Use a carpenter's level to verify that the FMS is level. If it is necessary to add or remove fill for leveling, tamp any added fill to maintain the base stability.

3.4   Cable Conduit Installation

Select the conduit entrance holes (see Figure 5) for the OSP feeder and distribution cables. If necessary, additional conduit entrance holes may be cut using a power drill and hole saw. Place and route the conduit into the entrance hole(s). If preferred, the FMS may be installed without conduit. OSP cables may be routed into the FMS at any point that is convenient. Cut the cable entrance hole to match the size of the cable.

3.5   Grounding System Installation

Install a grounding system (not provided) that meets all local electrical codes. Check local codes for grounding system installation, use of clamps, wire size, and any other grounding requirements. Typically, #6 AWG copper wire is used for the grounding wire. Install the grounding system inside the FMS where it will not interfere with the conduit or cables. Leave sufficient slack in the grounding wire to allow it to be routed into the cabinet after the cabinet is mounted on the sleeve.

3.6   Back Fill

If installing conduit, hand shovel stone aggregate under the conduit to avoid damage from the power tamper. Complete the back fill as follows:

1. Add stone aggregate evenly around the FMS and tamp. Fill to approximately 6 inches (15.2 cm) from the top of the excavation.

2. Complete the back-fill with crushed rock or topsoil depending on the landscaping requirements. The top surface of the mounting sleeve may be located from 0 to 4 inches (10.2 cm) above the surrounding grade (see Figure 5).

3.7   Mounting the Cabinet on the FMS

Use the 216B key tool to un-latch and latch the cabinet doors as needed during the mounting process. Refer to Figure 7 as necessary when mounting the cabinet. Use the following procedure to mount the cabinet on the FMS:

⚠ **Warning:** *Use appropriate lifting equipment when moving or installing the cabinet. Do not stand under a cabinet as it is being hoisted into position for mounting. A failure of the lifting equipment could result in serious personal injury.*

1. Use a 3/16-inch security hex-head wrench to remove the screws that secure the access covers to the left and right sides of the cabinet ground spacer/riser as shown in Figure 8.

2. Remove the access covers from the ground spacer/riser and set aside both the covers and the screws for reuse.

3. Mount the FMS adapter cover on the FMS and secure using the two capscrews and flat washers provided. Tighten each capscrew securely.

4. Place the isolation gasket (provided with cabinet) on the adapter cover and align the holes in the gasket with the holes in the adapter cover. Make sure the wide side of the gasket is on the side of the adapter cover that corresponds to the front side of the cabinet.

Figure 8. Removing Access Cover From Front of Ground Spacer/Riser

5. If a ground spacer/riser (optional accessory) will be installed, place the spacer in position for mounting on the adapter cover. The isolation gasket installed in step 4 should remain in place between the adapter cover and ground spacer. If a ground spacer will not be installed, proceed to step 8.

6. Align the mounting holes in the spacer/riser with the mounting holes in the adapter cover.

7. Secure the spacer/riser to the adapter cover using the four capscrews, four lock washers, and four flat washers provided with the spacer. Tighten all capscrews securely.

8. Using appropriate lifting equipment, hoist the cabinet several feet into the air to provide access to the feeder and distribution cables.

⚠ **Danger:** *Do not stand directly under the cabinet as it is being hoisted into position for cable installation. A failure of the lifting equipment could result in serious personal injury.*

► **Note:** Label or tag the stub end of each cable so it can be identified after it is routed to the splice enclosure.

9. Carefully route the stubbed feeder and distribution cables through the rectangular opening in the ground spacer/riser or adapter cover and into the FMS.

10. Feed the stubbed feeder and distribution cables into the appropriate conduit sections and route to the splice enclosure (not provided). Some excess cable slack may be stored in the bottom of the FMS.

► **Note:** A separate splice enclosure (not provided) is required for splicing the cabinet OSP cables to network OSP cables. If required, splice enclosure may be mounted in the FMS.

11. Lower the cabinet onto the ground spacer/riser or adapter cover and align the mounting holes in the cabinet base with the threaded holes in the spacer/riser or cover. If a spacer/riser was not installed, leave the isolation gasket (installed in step 4) in place on the adapter cover.

12. Secure the cabinet to the adapter cover or spacer using the four capscrews, lock washers, and flat washers provided with the cover. Tighten all four capscrews securely.

13. Install the FMS sleeve cover onto the FMS and secure using the two capscrews and washers provided. Tighten both capscrews securely.

▶ **Note:** The FMS sleeve cover may be installed at a later time to the interior of the FMS sleeve to be accessed for cable installation, ground wire installation, or splicing.

14. For safety, the lifting eyes must be removed from the cabinet and either a) placed in the cabinet, or b) reinstalled upside down. Use the security key tool (accessory) to remove the lifting eye screws. For option a), store the lifting eyes inside the cabinet and then re-install the lifting eye screws in the cabinet. For option b), turn the lifting eyes upside down and then secure them to the cabinet with the original screws.

15. Reinstall the left and right access covers that were removed in step 1. Use the 3/16-inch security hex-head wrench to tighten the screws that secure each access cover to the sides of the cabinet ground spacer/riser.

3.8 Grounding Wire Connection To Cabinet

Prior to mounting the cabinet, a grounding system and grounding wire should have been installed (see Section 3.5) in the space below the cabinet. Use the following procedure to connect the grounding wire to the cabinet:

1. Locate the grounding wire that was installed prior to mounting the cabinet on the FMS.

2. Working from the bottom side of the cabinet, insert the grounding wire through the flexible membrane at the point indicated in Figure 9.

3. Attach the grounding wire to the cabinet grounding lug. The grounding lug can be used for #6 – #14 AWG wire.

Figure 9. Grounding Wire Connection To Cabinet

4. Tighten the grounding lug set screw securely.

4   MOUNTING THE CABINET ON A CONCRETE PAD

The Pad Mount Frame (PMF), shown in Figure 10, is a stainless steel frame that provides a mounting base for the cabinet when embedded in a concrete foundation.

⚠ **Caution:** *Mounting the cabinet directly on a concrete pad may cause chemical corrosive action to the cabinet. Use only the Pad Mount Frame (PMF) as a mounting base for the cabinet. Do not use caulking compounds as a sealer between the cabinet and the PMF.*

4.1   Installation Recommendations

The site chosen for the installation must conform to all local codes and any permits required must be obtained prior to the start of installation. The location must be accessible and provide adequate parking for worker and vehicle safety. Situate the concrete pad close to the trench that was used for routing the OSP fiber cables for the network distribution system. The installed cabinet must not create a visual or physical obstruction to vehicular or pedestrian traffic. Ensure that there is sufficient space on all sides to facilitate cabinet installation. Depending on the landscaping requirements, the top surface of the concrete pad may be located from 0 to 3 inches (7.6 cm) above the surrounding grade.

4.2   Base Construction and Conduit Installation

Prepare a base for the concrete pad that meets all local code requirements. The base must have a footing of 4 to 6 inches (10.2 to 15.2 cm) of sand or gravel (per local practice) on firmly compacted soil. Refer to the construction diagram in Figure 11 for details.

Install the cable conduit from below and position it so that the top of each upward bend will be located within the PMF opening at the indicated point. When installed, the top of the conduit should be located 1 to 2 inches (2.54 to 5.08 cm) **below** the top of the finished concrete pad. Install the conduit **before** pouring the pad.

A template is provided with the cabinet isolation gasket. The template may be used to determine the cable conduit locations. Place the template over the top of the PMF and align the top right corner of the template with the top right corner of the PMF as shown in Figure 12. The holes punched in the template show the locations for the conduit within the PMF.
Figure 12. Using the Template To Determine Duct Location Within the PMF

4.3 Concrete Pad Construction

Use the following procedure to construct the concrete pad:

1. Build a wood form for the concrete pad using 2 x 6 framing lumber as shown in Figure 13.

2. Locate the PMF as shown in the construction diagram (see Figure 11). When installed, the top surface of the PMF must be flush and level with the top of the concrete pad.

   ▶ **Note:** Use temporary top framing to keep the top surface of the PMF flush and level with the top of the concrete pad (see Figure 13).

3. Place reinforcing material inside the form but outside of the PMF.

4. Verify that the PMF and form are level. Depending on the landscaping requirements, the top surface of the concrete pad may be 0 to 3 inches (0 to 7.6 cm) above the final grade. The weld nuts are covered with plugs which must be left in place until the enclosure is mounted.

5. Pour the concrete to form the pad but do *not* pour concrete into the center area of the PMF.

▶ **Note:** Allow some concrete to flow under the flanges on the bottom of the PMF so the PMF will be locked in place when the concrete hardens. However, do not allow concrete to fill the center of the PMF. If necessary, partially fill the center of the PMF with sand or gravel to prevent an inflow of concrete.

6. Remove the top framing and the temporary support wires when the concrete is ready to be finished.

7. Allow concrete to cure before proceeding with the installation.

4.4   Grounding System Installation

Install a grounding system (not provided) that meets all local electrical codes. Check local codes for grounding system installation, use of clamps, wire size, and any other grounding requirements. Typically, #6 AWG copper wire is used for the ground wire. If the grounding system includes a ground rod, install the rod (see Figure 11) within the PMF opening at the indicated point. When installed, the top of the rod should be located 1 to 2 inches (2.54 to 5.08 cm) **below** the top of the finished concrete pad. Leave sufficient slack in the grounding wire to allow it to be routed into the cabinet after the cabinet is mounted on the pad.

4.5   Mounting the Cabinet on the Concrete Pad

Use the 216B key tool to un-latch and latch the cabinet doors as needed during the mounting process. Refer to Figure 14 as necessary when mounting the cabinet.

⚠ **Warning:** *Use appropriate lifting equipment when moving or installing the cabinet. Do not stand under the cabinet as it is being hoisted into position for installation. A failure of the lifting equipment could result in serious personal injury.*

Use the following procedures to mount the cabinet on the concrete pad.

1. Use a 3/16-inch security hex-head wrench to remove the screws that secure the access covers to the left and right sides of the cabinet ground spacer/riser as shown in Figure 15.

2. Remove the plastic plugs that are installed in the threaded corner holes of the PMF and clean off any concrete that may have adhered to the top of the PMF.

   ▶ **Note:** Make sure all remnants of concrete are removed from the PMF prior to mounting the cabinet. It is not necessary to use shims to level or align the cabinet as long as the top surface of the PMF is clean and free of any installation debris.

3. Place the isolation gasket (provided with cabinet) on the PMF and align the holes in the gasket with the holes in the PMF. Make sure the wide side of the gasket is on the side of the PMF that corresponds to the front side of the cabinet.

4. If a ground spacer/riser (accessory) will be installed, place the spacer/riser in position for mounting on the PMF. The isolation gasket installed in step 3 should remain in place between the PMF and spacer/riser. If a spacer/riser will not be installed, proceed to step 7.

5. Align the mounting holes in the spacer/riser with the mounting holes in the PMF.

6. Secure the spacer/riser to the PMF using the four capscrews, four lock washers, and four flat washers provided. Tighten all capscrews securely.

7. Using appropriate lifting equipment, hoist the cabinet several feet into the air to provide access to the feeder and distribution cables.

⚠ **Danger:** *Do not stand directly under the cabinet as it is being hoisted into position for cable installation. A failure of the lifting equipment could result in serious personal injury.*

▶ **Note:** Label or tag the stub end of each cable so it can be identified after it is routed to the splice enclosure.

Figure 15. Removing Access Cover From Front of Ground Spacer/Riser

8. Feed the stubbed feeder and distribution cables into the appropriate conduit sections and route to the splice enclosure (not provided).

▶ **Note:** A separate splice enclosure (not provided) is required for splicing the cabinet OSP feeder and distribution cables to the network cables.

9. Lower the cabinet onto the ground spacer/riser or PMF and align the mounting holes in the cabinet base with the threaded holes in the spacer/riser or PMF. If a spacer/riser was not installed, leave the isolation gasket (installed in step 3) in place on the PMF.

10. Secure the cabinet to the spacer/riser or PMF using the four capscrews, four lock washers, and four flat washers provided with the cabinet. Tighten all four capscrews securely.

11. For safety, the lifting eyes must be removed from the cabinet and either a) placed in the cabinet, or b) reinstalled upside down. Use the security key tool (accessory) to remove the lifting eye screws. For option a), store the lifting eyes inside the cabinet and then re-install the lifting eye screws in the cabinet. For option b), turn the lifting eyes upside down and then secure them to the cabinet with the original screws.

4.6 Grounding Wire Connection To Cabinet

Prior to mounting the cabinet, a grounding system and grounding wire should have been installed (see Section 4.4) in the space below the cabinet. Use the following procedure to connect the grounding wire to the cabinet:

1. Locate the grounding wire that was installed prior to mounting the cabinet on the pad.

2. Working through the access openings in the base of the cabinet, insert the grounding wire through the flexible membrane at the point indicated in Figure 16.

3. Attach the grounding wire to the cabinet grounding lug. The grounding lug can be used for #6 – #14 AWG wire.

4. Tighten the grounding lug set screw securely.

5. Reinstall the left and right access covers that were removed in step 1 of Section 4.5. Use the 3/16-inch security hex-head wrench to tighten the four screws that secure each access cover to the sides of the cabinet ground spacer/riser.

Figure 16. Grounding Wire Connection To Cabinet

5   FEEDER AND DISTRIBUTION CABLE CONFIGURATION INFORMATION

The outdoor FDH 3000 288 termination cabinet is equipped with pre-installed OSP feeder and distribution cables. The cable stub ends must be spliced to the network feeder and distribution cables at a separate splice enclosure (not provided). The feeder and distribution stub cables are 100 feet (30.5 meters) in length. The following sections describe how the cables are configured for splicing.

5.1   OSP Feeder Cable Configuration

The feeder cable may have a fiber count of 12, 24, or 48 fibers depending on the option ordered. Within the cabinet, the feeder cable is secured with a pair of clamps. Beyond the clamps, the outer sheath of the cable is removed to expose the optical fiber subunits. Depending on the option ordered, the cable subunits are routed to the splitter compartment and/or the sliding adapter pack. The subunits are numbered and the individual fibers are color-coded for identification. Always perform a light test before splicing to determine the port location for each fiber. A diagram of the feeder cable routing is shown in Figure 17.

Figure 17. Feeder Cable Typical Configuration

5.2   OSP Distribution Cable Configuration

Each distribution cable has a fiber count that is a multiple of 72. From 1 to 4 distribution cables may be present depending on the number of distribution panels ordered and the cable fiber count. Within the cabinet, each distribution cable is secured with a pair of clamps. Beyond the clamps, the outer sheath of the cable is removed to expose the optical fiber subunits. Each subunit is fanned out into 12 individual fibers, each of which is terminated with a connector.

The fiber subunits are routed to the back of each distribution panel. Each fiber connector is connected to a specified bulkhead adapter at the rear of the panel. Depending on the option ordered, the distribution panels may be equipped with either UPC/SC or APC/SC adapters. A diagram of the distribution cable configuration is shown in Figure 18. Distribution cables with 72, 144, 216, or 288 fibers are available.

Designation labels are provided on the cabinet doors for recording subscriber information for each distribution panel port. The labels indicate the fiber number and cable number associated with each fiber port. The subunits are numbered for identification and the individual fibers are color-coded for identification. Always perform a light test before splicing to verify the port location for each fiber.

Figure 18. Distribution Cable Configuration

6 SPLITTER MODULE INSTALLATION

The outdoor FDH 3000 288 termination cabinet can accommodate up to twenty-four splitter modules. Plug and play splitter modules are equipped with either one or two input connectors and up to thirty-two output fibers. The splitter modules insert into slots in the splitter compartment. Inserting a splitter into a slot connects the splitter input connector(s) to the feeder cable connector(s). The splitter output fibers may be either stored for later use or routed to the distribution panels for connection to the distribution ports.

Use the 216B key tool to un-latch and open the cabinet door as needed during the splitter installation process. Use the following procedure to install additional splitters in the cabinet:

1. Open the cabinet door and the cabinet swing frame to provide access to the splitter compartment.

2. Locate the next available splitter mounting position as shown in Figure 19.

▶ **Note:** Install splitters in the order shown, beginning on the left side of the splitter compartment and then working toward the right.

3. Remove the dust cap assembly from the selected splitter slot.

Figure 19. Splitter Module Mounting Slots

4. Remove the corresponding feeder cable connector(s) from the rear of the splitter compartment as shown in Figure 20.

⚠ **Warning:** *Infrared radiation is invisible and can seriously damage the retina of the eye. Do not look into the ends of any optical fiber. Do not look directly into the optical adapters or connectors. Exposure to invisible laser radiation may result. An optical power meter should be used to verify active fibers. A protective cap or hood MUST be immediately placed over any radiating adapter or optical connector to avoid the potential of dangerous amounts of radiation exposure. This practice also prevents dirt particles from entering the adapter or connector.*

Figure 20. Feeder Cable Connector

5. Clean the feeder cable connector(s) as specified in the Optical Fiber Systems Cleaning and Mating Instructions (ADCP-90-159).

6. Reinstall the feeder cable connector(s) at the rear of the splitter compartment.

7. Remove the protective tape and dust cap from the splitter connector as shown in Figure 21.

8. Clean the splitter connector as specified in the Optical Fiber Systems Cleaning and Mating Instructions (ADCP-90-159).

9. Grasp the splitter using thumb and forefinger (see Figure 21) and gently squeeze the locking tab against the lower tab.

10. Carefully slide splitter into the mounting slot. Listen for a click to ensure full engagement.

⚠ **Caution:** *Applying excessive force to the splitter during installation can cause splitter damage. If resistance is encountered when sliding the splitter into the mounting slot, remove the splitter and verify that the splitter dust cap has been removed and that no obstructions are present.*

11. Route the splitter output fibers to the storage panel. Refer to Section 8 for the fiber routing and connector pack installation procedure.

7   DISTRIBUTION PANEL INSTALLATION

The outdoor FDH 3000 288 termination cabinet can support up to four 72-position distribution panels. Cabinets can be ordered with 1, 2, 3, or 4 distribution panels pre-installed in the cabinet. If the cabinet is equipped with less than four distribution panels, additional panels may be installed as needed. Pre-cabled distribution panels are available separately for installation in unused distribution panel mounting slots. Use the following procedure to install a distribution panel in an unused mounting slot:

1. Remove the nuts that secure the cable entry/exit hole cover to the bottom of the cabinet as shown in Figure 22. Save nuts for reuse.

GROUNDING SYSTEM

26304-A

**CABLE ENTRY/EXIT HOLE COVER**

Figure 22. Cable Entry/Exit Hole Cover

2. Remove the cable entry/exit hole cover and attached flexible membrane from the bottom of the cabinet.

3. Locate the cable clamping position specified for the next distribution cable as shown in Figure 23.

4. Remove the cable clamp assembly (attached to lower portion of the cable clamp bracket) that corresponds to the selected cable clamping position.

5. Feed the distribution cable through the specified cable entry/exit hole and into the cable duct or fiberglass mounting sleeve that is located beneath the cabinet. Pull all excess slack out of the cable.

6. Using the two screws provided, secure the cable clamp plate (attached to cable) to the cable bracket at the rear of the cabinet.

7. Assemble the cable clamp (and grommet if required) on the cable as shown in Figure 24 and secure the cable to the lower part of the cable clamp bracket.
Figure 23. Secure Distribution Cable to Cable Bracket

Figure 24. Cable Clamp Assembly

8. Reinstall the cable entry/exit hole cover removed in step 1.

9. Place the distribution panel in position for mounting on the **rear** side of the swing-out assembly as shown in Figure 25. Use the plastic push pins provided to secure the distribution panel to the rear side of the swing-out assembly.

Figure 27. Route and Secure Distribution Cable Subunits

12. If a grounding stud is provided on the cable, connect a #6 AWG jumper cable (provided with cabinet) to the cable grounding stud.

13. Locate the weather-seal strip attached to the right side of the cabinet grounding system as shown in Figure 28.

14. Push the free end of the #6 jumper cable through the hole in the weather-seal strip that corresponds to the number of the fiber optic cable.

▶ **Note:** The fiber optic cables are numbered 1 – 8 starting with the first cable on the right side of the cabinet. The holes for the grounding cables are numbered 1 – 8 starting with the top opening in the weather strip.
WEATHER-SEAL STRIP

GROUNDING SYSTEM

JUMPER CABLE ROUTING FOR OPTICAL CABLE #4

26309-A

Figure 28. Cable Grounding System - Interior View

15. Open the grounding system access cover located at the rear side of the cabinet as shown in Figure 29.

16. Identify the grounding stud that corresponds to the fiber optic cable number.

▶ **Note:** A label is provided on the back of the access cover that indicates the grounding stud numbers.

17. Connect the grounding jumper cable to the grounding stud identified in step 16.

▶ **Note:** Each grounding stud on the **left** bus bar is equipped with two nuts. When connecting a jumper cable to the **left** bus bar, place the cable terminal **between** the two nuts.

18. Tighten the grounding stud nut to 30 to 35 lbs force-inches. (3.4 to 4.0 Nm) of torque.
Figure 29. Cable Grounding System - Exterior View

⚠️ **Warning:** *The grounding cables are connected to cabinet ground through the copper grounding blocks. Failure to properly tighten the nut on each individual cable grounding stud could result in improper grounding of the cable and result in performance or safety issues.*

19. Close the cable grounding system access door and secure using the 216B tool.

8 ROUTING AND CONNECTING THE SPLITTER OUTPUT FIBERS

The splitter modules are mounted at the top of the outdoor FDH 3000 288 termination cabinet. When a splitter module is initially installed, the output fibers are routed to the storage panel located at the bottom of the cabinet.

At the storage panel, the output fibers are temporarily "parked" until they are needed. Service to a subscriber is enabled by removing an unused output fiber from the storage panel, routing it to the appropriate distribution panel, and then connecting it to the subscriber port.

8.1 Storing The Splitter Output Fibers

Use the following procedure to store the splitter output fibers.

1. Following installation of a splitter module, locate an open connector pack slot in the storage panel at the bottom of the cabinet.

2. Insert the connector pack into the unused slot in the storage panel. Refer to the FDH 3000 Plug and Play Splitter Installation Guide (ADCP-96-087) provided with splitter modules for additional information on installing connector packs in the storage panel.

3. Use the radius limiters on the right side of the cabinet to store any excess fiber slack. Refer to Figure 30 for the routing guidelines.

Figure 30. Routing Splitter Output Fibers

8.2 Enabling Service To a Subscriber

Use the following procedure to enable service to a subscriber:

1. Check the designation labels on the cabinet doors to determine the distribution panel and port number that corresponds to the address of the subscriber.

2. Locate the subscriber port on the specified distribution panel and remove both the adapter dust cap and the connector ferrule dust cap.

3. Select and remove an unused splitter output fiber from the storage panel and carefully work it free of any other fibers.

⚠ **Warning:** *Infrared radiation is invisible and can seriously damage the retina of the eye. Do not look into the ends of any optical fiber. Do not look directly into the optical adapters or connectors. Exposure to invisible laser radiation may result. An optical power meter should be used to verify active fibers. A protective cap or hood MUST be immediately placed over any radiating adapter or optical connector to avoid the potential of dangerous amounts of radiation exposure. This practice also prevents dirt particles from entering the adapter or connector.*

4. Remove the ferrule dust cap from the connector and then clean the connector as specified in the Optical Fiber Systems Cleaning and Mating Instructions (ADCP-90-159).

5. Connect the splitter output fiber connector to the subscriber port.

6. Use the radius limiters on the right side of the cabinet to store any excess fiber slack. Refer to Figure 30 for the routing guidelines

9   PASS-THROUGH ROUTING PROCEDURE

Pass-through routing is used when it is necessary for a feeder cable optical signal to be routed directly to a distribution port. This involves connecting a patch cord between the terminated feeder cable connector and the appropriate distribution port. Because feeder cable fibers can be terminated at either the sliding adapter pack or the splitter compartment, two pass-through routing procedures are provided.

9.1   Sliding Adapter Pack Pass-Through Routing Procedure

Use the following procedure to route a jumper patch cord between the feeder cable sliding adapter pack and one of the distribution connector panels.

1. Open the swing frame and locate the appropriate feeder cable connector on the sliding adapter pack.

2. Pull upward on the small tab on top of the adapter pack and lift the adapter pack to the position shown in Figure 31

Figure 31. Typical Adapter Pack Raised to Access Position

⚠ **Warning:** *Infrared radiation is invisible and can seriously damage the retina of the eye. Do not look into the ends of any optical fiber. Do not look directly into the optical adapters or connectors. Exposure to invisible laser radiation may result. An optical power meter should be used to verify active fibers. A protective cap or hood MUST be immediately placed over any radiating adapter or optical connector to avoid the potential of dangerous amounts of radiation exposure. This practice also prevents dirt particles from entering the adapter or connector.*

3. Remove the feeder cable connector from the front side of the bulkhead adapter and clean the connector as specified in the Optical Fiber Connector Wet and Dry Cleaning Instructions (ADCP-90-159) or by locally approved procedures.

4. Reconnect the feeder cable connector to the bulkhead adapter.

5. Remove the dust cap from the rear side of the bulkhead adapter.

6. Obtain the optical patch cord (accessory) recommended for the pass-through connection.

▶ **Note:** Use catalog# FPCFW-APSC-P-1.9M for APC/SC connectors.
    Use catalog# FPCFW-SPSC-P-1.9M for UPC/SC connectors.

7. Remove the ferrule dust cap from one of the patch cord connectors and then clean the connector as specified in the Optical Fiber Connector Wet and Dry Cleaning Instructions (ADCP-90-159) or by locally approved procedures.

8. Insert the patch cord connector into the bulkhead adapter in the sliding adapter pack.

9. Slide the adapter pack down into the closed position.

10. Route the pass-through patch cord to the front side of the swing-out assembly as shown in Figure 32.

⚠ **Caution:** *Always allow sufficient fiber length to permit routing without severe bends. Non reduced bend radius fibers may be permanently damaged if bent or curved to a bend radius of less than 1.5 inches (3.81 cm).*

11. Locate the distribution panel and the optical port to which the pass-through patch cord is to be routed.

12. Refer to the procedures in Section 8.2 to route the pass-through patch cord to the distribution panel and to connect the patch cord connector to the appropriate optical port. Maintain a 1.5-inch minimum bend radius for all non reduced bend radius fiber.

13. Close swing frame when pass-through routing procedure is complete.

Figure 32. Routing Pass-Through Patch Cord From Sliding Adapter Pack

9.2   Splitter Compartment Pass-Through Routing Procedure

Use the following procedure to route a jumper patch cord between the splitter compartment and one of the distribution cable connector panels.

1. Open the swing frame and locate an open splitter mounting position.

2. Remove the dust cap assembly from the selected splitter slot.

3. Remove the feeder cable connector(s) from the rear of the splitter compartment (see Figure 20).

⚠ **Warning:** *Infrared radiation is invisible and can seriously damage the retina of the eye. Do not look into the ends of any optical fiber. Do not look directly into the optical adapters or connectors. Exposure to invisible laser radiation may result. An optical power meter should be used to verify active fibers. A protective cap or hood MUST be immediately placed over any radiating adapter or optical connector to avoid the potential of dangerous amounts of radiation exposure. This practice also prevents dirt particles from entering the adapter or connector.*

4. Clean the feeder cable connector(s) as specified in the Optical Fiber Systems Cleaning and Mating Instructions (ADCP-90-159).

5. Reinstall the feeder cable connector(s) at the rear of the splitter compartment.

6. Obtain the optical patch cord (accessory) recommended for the pass-through connection.

> **Note:** Use catalog# FPCFW-APSC-P-1.3M for APC/SC connectors.
>   Use catalog# FPCFW-SPSC-P-1.3M for UPC/SC connectors.

7. Remove the ferrule dust cap from one of the patch cord connectors and then clean the connector as specified in the Optical Fiber Connector Wet and Dry Cleaning Instructions (ADCP-90-159) or by locally approved procedures.

8. Install the patch cord connector in the dust cap assembly as shown in Figure 33.

Figure 33. Installing Patch Cord Connector in Dust Cap Assembly

> **Note:** Two patch cord connectors may be installed in the dust cap assembly if required.

9. Connect the patch cord connector(s) to the feeder cable connector(s) by inserting the dust cap assembly into the splitter slot as shown in Figure 34.

10. Locate the distribution panel and the optical port to which the pass-through patch cord is to be routed.

11. Refer to the procedures in Section 8.2 to route the pass-through patch cord to the distribution panel and to connect the patch cord connector to the appropriate optical port.

12. Close swing frame when pass-through routing procedure is complete.

**DUST CAP AND
CONNECTOR
ASSEMBLY**

26313-A

Figure 34. Inserting Dust Cap Assembly Into Splitter Compartment

10 FEEDER CABLE FIBER RE-ROUTING PROCEDURE

The feeder cable fibers may be terminated by the factory at either the sliding adapter pack or at the splitter compartment. Feeder cable fibers that were terminated at the sliding adapter pack may sometime require re-termination at the splitter compartment.

Use the following procedure to re-route a feeder cable fiber from the sliding adapter pack to the splitter compartment.

1. Open the swing frame and locate the sliding adapter pack.

2. Locate the feeder cable fiber that requires re-termination at the splitter compartment.

3. Pull upward on the small tab on top of the adapter pack and lift the adapter pack to the position shown in Figure 31

Figure 35. Typical Adapter Pack Raised to Access Position

4. Disconnect the feeder cable connector from the front side of the sliding adapter pack and place a dust cap over the connector ferrule. This will protect the connector since it will be difficult to prevent the connector from contacting other objects during the re-routing procedure.

⚠ **Warning:** *Infrared radiation is invisible and can seriously damage the retina of the eye. Do not look into the ends of any optical fiber. Do not look directly into the optical adapters or connectors. Exposure to invisible laser radiation may result. An optical power meter should be used to verify active fibers. A protective cap or hood MUST be immediately placed over any radiating adapter or optical connector to avoid the potential of dangerous amounts of radiation exposure. This practice also prevents dirt particles from entering the adapter or connector.*

5. Place a dust cap over the exposed bulkhead adapter and then slide the adapter pack down to the closed position.

6. Carefully unwind the feeder fiber from the radius limiters located on the bottom and on the left side of the swing-out assembly. Figure 36 shows the section of the fiber that will need to be released for re-routing. When necessary, backfeed the fiber to free the connector from the remaining fibers.

7. When the feeder cable connector and fiber are free, pass the connector through the opening located behind the splitter compartment as shown in Figure 37.

8. Remove the ferrule dust cap from the feeder cable connector and then clean the connector as specified in the Optical Fiber Connector Wet and Dry Cleaning Instructions (ADCP-90-159) or by locally approved procedures.

9. Insert the feeder fiber connector into the appropriate bulkhead adapter (remove dust cap from adapter) at the rear of the splitter compartment as shown in Figure 38.

NOTE: SHOWN WITHOUT DISTRIBUTION PANELS TO ALLOW VIEWING OF CABLE ROUTING

UNCOIL FEEDER CABLE FIBER FROM BOTH SETS OF RADIUS LIMITERS

26314-A

Figure 36. Uncoiling the Feeder Cable Fiber

▶ **Note:** The splitter slot should not be left empty after the feeder fiber is connected to the bulkhead adapter at the rear side of the splitter compartment. Either a dust cap assembly or a splitter should be installed in the mounting slot.

10. Route the feeder fiber through the two cable rings located at the top of the swing frame assembly.

11. Store the excess slack on the radius limiters located on the left side of the swing frame assembly.

12. Close the swing frame when the feeder re-routing procedure is completed.
Figure 37. Re-Routing the Feeder Cable Fiber

Figure 38. Feeder Cable Connector

11 MAINTENANCE AND REPAIR PROCEDURES

The outdoor FDH 3000 288 termination cabinet requires no regular maintenance to insure continuous and satisfactory operation. Maintenance is limited to repairing or replacing any cabinet components that may be damaged or broken in the course of normal operation. The following sections provide procedures for repairing or replacing common cabinet components.

11.1 Painting

Brush-in-cap type bottles of paint are available for touching-up nicks and scratches in the factory coat of paint. Lightly sand the area to be painted and then clean it thoroughly to remove any dirt, dust, or foreign matter. Shake the paint bottle until thoroughly mixed and then apply a light coat of paint to the damaged area using the small brush attached to the cap. Wait until the paint is dry and then apply a second coat if necessary. When finished painting, replace the paint bottle cap and tighten securely. The catalog number for the paint kit is ACE-ACC-PTALMD.

11.2 Distribution Panel Adapter Replacement

Replacement adapters are available for the distribution panels. Use the following procedure to remove and replace a damaged adapter:

1. Disconnect the splitter connector from the front side of the broken adapter as shown in Figure 39 and install a dust cap on the connector.

⚠ **Warning:** *Infrared radiation is invisible and can seriously damage the retina of the eye. Do not look into the ends of any optical fiber. Do not look directly into the optical adapters or connectors. Exposure to invisible laser radiation may result. An optical power meter should be used to verify active fibers. A protective cap or hood MUST be immediately placed over any radiating adapter or optical connector to avoid the potential of dangerous amounts of radiation exposure. This practice also prevents dirt particles from entering the adapter or connector.*

Figure 39. Adapter Removal and Replacement

2. Unlatch and fully open the cabinet swing frame to provide access to the rear side of the distribution panel.

3. Disconnect the distribution connector from the rear side of the broken adapter and install a dust cap on the connector.

⚠ **Caution:** *Use extreme care when removing a connector or an adapter from the distribution panel to avoid macro bending the adjacent fibers.*

4. Working from the rear side of the distribution panel, use a large tweezers or two small screwdrivers (blade type) to depress the two metal tabs that retain the adapter in the panel. With both tabs depressed, push forward on the adapter until it pops out of the panel.

5. Discard the damaged adapter.

6. Install the replacement adapter by inserting it into the distribution panel from the front and then pushing it toward the back until it snaps into place.

▶ **Note:** Make sure the keyway in the replacement adapter is facing in the same direction as the keyways in the rest of the adapters installed in the distribution panel.

7. Clean the distribution and splitter fiber connectors as specified in the Optical Fiber Systems Cleaning and Mating Instructions (ADCP-90-159).

8. Connect the distribution connector to the rear side of the replacement adapter.

9. Close the cabinet swing frame.

10. Connect the splitter connector to the front side of the replacement adapter.

11.3 Splitter Compartment Adapter Replacement

Replacement adapter assemblies are available for the splitter compartment. Use the following procedure to remove and replace a damaged adapter assembly:

1. Unlatch and fully open the cabinet swing assembly to provide access to the both the front and rear side of the splitter compartment.

2. Remove the splitter or the dust cap assembly from the front side of the broken adapter assembly.

⚠ **Warning:** *Infrared radiation is invisible and can seriously damage the retina of the eye. Do not look into the ends of any optical fiber. Do not look directly into the optical adapters or connectors. Exposure to invisible laser radiation may result. An optical power meter should be used to verify active fibers. A protective cap or hood MUST be immediately placed over any radiating adapter or optical connector to avoid the potential of dangerous amounts of radiation exposure. This practice also prevents dirt particles from entering the adapter or connector.*

3. Remove the feeder cable connector(s) from the rear side of the broken adapter assembly as shown in Figure 40 and install a dust cap on the connector(s).

4. Turn the thumb screw on the top of the broken adapter assembly clockwise until the adapter assembly detaches from the top of the splitter compartment.

5. Discard the damaged adapter assembly.

Figure 40. Splitter Compartment Adapter Replacement

6. Install the replacement adapter assembly in the splitter compartment and secure it by turning the thumbscrew counter-clockwise until tight.

7. Clean the feeder cable connector(s) as specified in the Optical Fiber Systems Cleaning and Mating Instructions (ADCP-90-159).

8. Connect the feeder cable connector to the rear side of the replacement adapter assembly.

9. Connect the dust cap or splitter to the front side of the replacement adapter assembly.

10. Close the cabinet swing assembly.

11.4 Replacing a Damaged Fiber or Connector

A damaged fiber or connector can usually be replaced. The following describes the various replacement options.

*   **Damaged Splitter Output Fiber:** Replace the splitter output fiber from the connector all the way back into the splitter. Splice a new pigtail (use only pigtails with bend-optimized fiber) to the remaining section of the old fiber within the splitter chassis. This procedure requires removing and disassembling the splitter to insert a splice chip and to perform the splice. A kit is available from ADC. Refer to ADCP-96-034 for the procedure.

*   **Damaged Distribution or Feeder Connector:** Replace the connector at the bulkhead adapter if just the connector alone is damaged. Use a field-installable connector replacement kit. Refer to Section 11.4.1 for the replacement procedures.

11.4.1 Splitter Output Fiber Connector Replacement

Use the following procedure to replace the connector:

1. Disconnect the damaged connector and the good connector from the adapter and install a dust cap on the good connector.

⚠️ **Warning:** *Infrared radiation is invisible and can seriously damage the retina of the eye. Do not look into the ends of any optical fiber. Do not look directly into the optical adapters or connectors. Exposure to invisible laser radiation may result. An optical power meter should be used to verify active fibers. A protective cap or hood MUST be immediately placed over any radiating adapter or optical connector to avoid the potential of dangerous amounts of radiation exposure. This practice also prevents dirt particles from entering the adapter or connector.*

2. Replace the damaged connector as specified in the procedures provided with the field-installable connector replacement kit.

3. Clean both connectors as specified in the Optical Fiber Connector Wet and Dry Cleaning Instructions (ADCP-90-159) or by locally approved procedures.

4. Reconnect the good connector and the replacement connector to the adapter.

11.5 Door Gasket Replacement

Damaged door gaskets may be replaced using the door gasket kit which includes a roll of gasket material. The ideal installation temperature for the adhesive used on the replacement gaskets is between 60 and 100º F (16 and 38º C). Installation is not recommended if the temperature is below 50º F (10º C). Remove any damaged sections of gasket material from the door. If necessary, use a citrus based adhesive cleaner to remove any adhesive that may stay attached to the door. Cut replacement lengths of gasket material from the roll as needed. Remove the paper backing to expose the adhesive and then carefully apply the replacement gasket to the door. Take care not to leave any gaps between the meeting sections of the gasket strips.

11.6 Door Replacement

Damaged cabinet doors may be replaced using the door replacement kit. Use the following procedure to remove and replace the cabinet doors:

1. Open both cabinet doors and lock them in the open position as shown in Figure 41.

2. Use a 3/8-inch nut driver and wrench to remove the locking nuts and washers that secure the door bracket slide to the bottom edge of the door as shown in Figure 42. Save the nuts and washers for reuse.

3. Use a 3/8-inch nut driver to remove the locking nuts that secure hinges to the door. Save nuts for reuse.

▶ **Note:** Support the door as the last nuts are removed to prevent the door from falling.

**Figure 41. Door Replacement**

Figure 42. Door Linkage Hardware

4. Carefully lift the door away from the cabinet.

5. Transfer all designation information that may be recorded on the damaged door to the labels on the replacement door.

6. Place the replacement door in position for installation on the hinges.

7. Reinstall the locking nuts (saved in step 3) that secure each hinge to the door.

▶ **Note:** Be sure to re-secure the grounding strap lug (see Figure 41) to the door when securing the hinges to the door.

8. Secure the door bracket slide to the bottom edge of the door using the locking nuts and washers saved in step 2.

9. Repeat process for the left door.

10. Close doors and check for proper operation.

11.7 Grounding System Terminal Access Procedure

Fiber optic cables with metallic strength members or shields are grounded to a common grounding system. The grounding system is designed to allow the metallic elements of each cable to be isolated for connection of cable locating equipment. The grounding system terminals may be accessed through a small cover located on the rear side of the cabinet. Use the following procedure to access and isolate the metallic elements of individual cables:

1. Locate the small hinged access cover at the rear side of the cabinet as shown in Figure 43.

2. Use the 216B tool to remove the screw that secures the access cover in the closed position.

3. Swing open the cover and locate the grounding stud that corresponds to the cable to be located.

▶ **Note:** A designation label is provided on the access cover for identifying cables.

4. Remove the stud nut and disconnect the cable so that it is not touching the copper bus bar assembly.

5. Attach cable detection equipment to the isolated grounding cable and complete the cable location procedure.

6. When finished locating cables, reconnect the cable terminal to the grounding stud.

7. Tighten the grounding stud nut to 30 to 35 lbs force-inches. (3.4 to 4.0 Nm) of torque.

⚠ **Warning:** *The grounding cables are connected to cabinet ground through the copper grounding blocks. Failure to properly tighten the nut on each individual cable grounding stud could result in improper grounding of the cable and result in performance or safety issues.*
8. Close and secure access cover.
